SHIPPING SOLUTION

- CONTAINER
- PALLET
- TRUCK

The Company

The Shipping Solutions division of Eurolog SRL specializes in the design and manufacturing of products for cargo conditioning, offering solutions that improve the international transportation of merchandise.

Savings

- > Significantly reduce claims against insurance companies for damages.
- > The protection with Airbags is simple and fast.

AIRBAGS

Safety Elements is a line of products specially designed to offer protection and security for your merchandise through the entire logistic chain.

Airbags

Airbags protect the merchandise by filling free space generated in the interior of the container, truck or ship storeroom and preventing object displacement.

They are resistant to environmental humidity and support the strain of up to several tons.

The bags are placed deflated in the space between the merchandise and are filled in less than a minute with compressed air.

When the merchandise arrives at its destination, the Airbags are deflated within seconds for their removal with complete security for the person handling them.

They are available for a one-time use or for several in different sizes and they protect almost any kind of product, regardless of the means of transportation.

Elements SAFETY

Pro-Dry

Humidity-absorbent.

Used to control the humidity within the container and for smaller presentations they can be applied to individual packages.

The amount of Silicagel to be applied will depend on the type of package to be used and the humidity conditions at the time of loading the cargo.

On average, it is recommended to use 1/2 kg per cubic meter of packaging.

Safety sealing tape

Allow a more extensive control of the merchandise as it controls the cargo during all stages of the logistic chain.

If its box is tampered with, a hidden legend (OPEN) will appear which will serve as a proof of the box's opening.

As an additional safety measure, the tape will show a series of printed numbers (as a seal) every 15 cm, which will prevent it from being replaced.

Disposable mechanical thermographs

Registers the temperature at 30, 45 and 60 days of duration. Ideal for controlling the temperature in the transportation of refrigerated and exportation containers.

The bimetallic thermometer registers the temperature on a detachable sensitive paper card. Unit dimensions: 18 x 11 x 5 cm; 5.6 kg Range of -28.9°C to 37.8°C, Precision +/- 2%
