- > Aluminized

- CONTAINER
- PALLET
- TRUCK

The Shipping Solutions division of Eurolog SRL specializes in the design and manufacturing of products for cargo conditioning, offering solutions that improve the international transportation of merchandise.

This product line was developed in order to offer thermal protection for merchandise that, due to its nature, is sensitive to temperature variations.

It can be adapted to any module and means of transport:

- 20', 40' and 40' HC Dry Containers
- Trucks
- Pallets
- Packages with special sizes

Eurolog makes various kinds of EuroCover by using different insulating materials depending on the thermal demand to which the merchandise will be exposed.

## Types of Materials

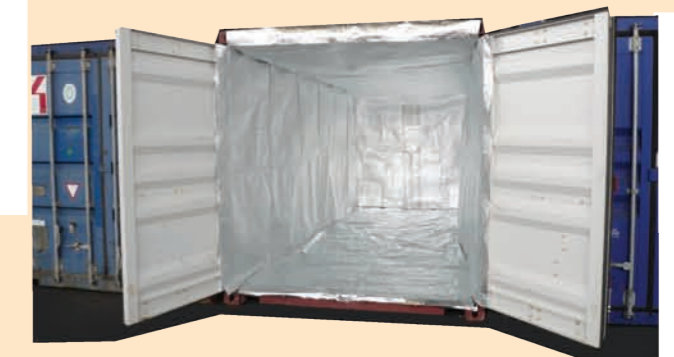

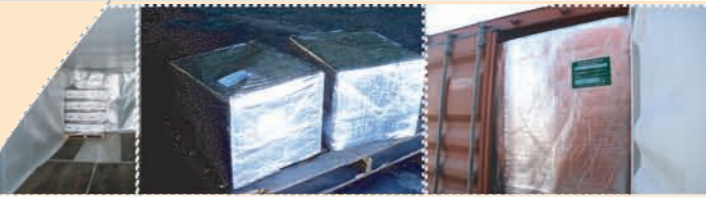

- 100% aluminium foil with polyethylene bubbles
- 100% double aluminium foil with polyethylene bubbles
- Woven polypropylene with 100% aluminum foil
- Aluminized polyethylene foil with bubbles of 10 mm
- Aluminized polyethylene foil with bubbles of 30 mm

These materials provide a barrier against high-level radiation since they reflect caloric radiation, and also halt thermal inertia by conduction.

All of these insulating membranes are manufactured under ISO 9002 norms and are completely recyclable and disposable in any country in the world.

## Advantages of using EuroCover®

- ✓ Significantly reduces freight costs as they do not need refrigerated containers.
- ✓ Protects the merchandise in situations of exposure to extreme temperatures. Consolidation in fiscal deposits, transshipment, storage in uncovered yards, delays in border passages.
- ✓ It does not require any machinery or special cargo system for its installation.
- One single operator can install it in a matter of minutes.
- Prevents the evaporation cycle and
- ✓ humidity condensation.
- Improves the presentation of your
- ✓ shipment.
